# 1 Introduction

Well, skip this and just read the rest. Less work for me.

## 2 Preliminaries

### 2.1 algebraic group actions

Torus as special case

### 2.2 Categorical quotients

### 2.3 GIT quotients & fans

Reduction of arbitrary groups to the torus case

### 2.4 Mori dream spaces, movable divisor classes?

## 3 Concept of the algorithm

### 3.1 Computing orbit cones

Monomial containment test Moving Cone

### 3.2 Traversing the GIT fan

### 3.3 Exploiting symmetry

# 4 Implementation

## 4.1 GPI-Space

## 4.2 Integration of Singular

drawbacks

## 4.3 Application flow & Concurrency

insbesondere beschreiben, wo die Unterschiede zwischen Single-Node und Cluster-enabled sind

## 4.4 Input & Output structure

## 4.5 Additional Features

an Kommandozeilenparameter entlanghangeln

## 4.6 Software testing

## 5 Applications

### 5.1 Grassmanian $\mathbb{G}(2, 5)$

### 5.2 Moduli space of stable curves of genus 0

## 6 Conclusion

Let  $p = x_1 x_3 + x_2 x_4 + x_5 \in \mathbb{K}[x_1, x_2, x_3, x_4, x_5] =: \mathbb{K}[\mathbf{x}]$ . Set

$$\mathfrak{a} := \langle x_3, x_4 \rangle \cdot \langle p \rangle,$$

$$Q = (q_1, q_2, q_3, q_4, q_5) := \begin{pmatrix} 0 & 0 & 1 & 1 & 1 \\ 1 & 0 & 0 & 1 & 1 \\ 1 & 1 & 1 & 1 & 2 \end{pmatrix}.$$

Note that  $Q$  defines a  $\mathbb{Z}^3$  grading on  $\mathbb{K}[x_1, x_2, x_3, x_4, x_5]_{/\mathfrak{a}}$  since  $p$  and therefore  $\mathfrak{a}$  is homogenous with respect to the grading  $\deg(x_i) = q_i$ . Thus, we obtain a torus action of  $(\mathbb{K}^*)^3$  on  $V(\mathfrak{a})$ .

The  $\mathfrak{a}$ -faces with full dimensional image in  $Q(\gamma)$ ,  $\gamma = \mathbb{Q}_{\geq 0}^5$ , are given by

$$\begin{aligned} \gamma_1 &:= \langle e_1, e_2, e_5 \rangle \\ \gamma_2 &:= \langle e_1, e_2, e_3, e_5 \rangle \\ \gamma_3 &:= \langle e_1, e_2, e_4, e_5 \rangle \\ \gamma_4 &:= \langle e_1, e_3, e_4, e_5 \rangle \\ \gamma_5 &:= \langle e_2, e_3, e_4, e_5 \rangle \\ \gamma_6 &:= \langle e_1, e_2, e_3, e_4 \rangle \\ \gamma_7 &:= \langle e_1, e_2, e_3, e_4, e_5 \rangle \end{aligned}$$

This is easily seen by sending all variables  $x_i$  with  $e_i \notin \gamma_j$  in  $\mathfrak{a}$  to zero and check that the new ideal does not contain any monomials. (details see below)

The orbit cones  $Q(\gamma_j) \in \mathbb{Q}_{z_1, z_2, z_3}^3$  have the following form when intersecting them with the  $\{z_3 = 1\}$ -plain (vice versa, the orbit cones are recovered by expanding the polytopes in  $z_3$ -direction to cones in  $\mathbb{Q}^3$ ):

# A Something appendixable

**Theorem A.1 (Great theorem)** *Problem in appendix.*

Proof: by intimidation.
